

ACT 1:

The base layer is for main animations like idle, walk or sneaking. For the second layer which only changes the animation on the selected IK by using layer weight and avatar mask I (in this case I used hand IK to for weapon handling and changing it with using 1, 2, 3 to change the pose)

Act 2:

I set the pose speed to 0 then apply them to a walk animation and adjusted the weight to blend the pose in, and some poses shifted the character, so I fixed the root position by copying the walk animation's frame 0 root and pasting it onto the additive clip

I played the walk animation and gradually increased the layer weight also there was some problems like the poses shifted the character
